

Nokia E65

The Nokia E65 is just one of a growing list of Nokia smartphones to feature the S60 Symbian 9.1 operating system, but is arguable one of the most compact, and most attractive products on the list.

The E65 does everything that you may have come to expect from a modern smartphone in terms of office, and organizer based applications, but the E65 delivers these functions in a more user friendly and stylish manner than alternative products. Conference calls for example are made easy by the one-touch conference key, and the mute microphone button helps to cut out background noise often associated with multi participant conversations.

In terms of connectivity, the E65 is as up to date as can be expected, with quad-band EGSM, WCDMA (3G), Wi-Fi, USB 2.0, IrDA and Bluetooth 1.2 all supported. However, it should be noted that on the E65, Nokia have chosen to omit a forward facing video call camera meaning that the WCDMA connection may only be used for data, and not 3G video calls. The Wi-Fi connectivity featured on the E65 allows for convenient internet access in areas covered by a wireless network. In addition to reducing the cost of browsing for regular mobile internet users, this feature also provides the opportunity to make low cost VOIP calls over WLAN.

Continuing the tradition of great communication as previously seen on E Series phones, the messaging capability of the E65 is notably good in supporting push email services from Nokia (Intellisync), Microsoft (Exchange), Blackberry (Blackberry Connect), Good (Mobile Messaging) Visto, and more. For those who might benefit from always-on access to email, and don't mind using the number pad to compose messages, a device such as the E65 is an ideal option.

Available in Red and Moca, the E65 is the clear choice for the modern, fashionable business person.
